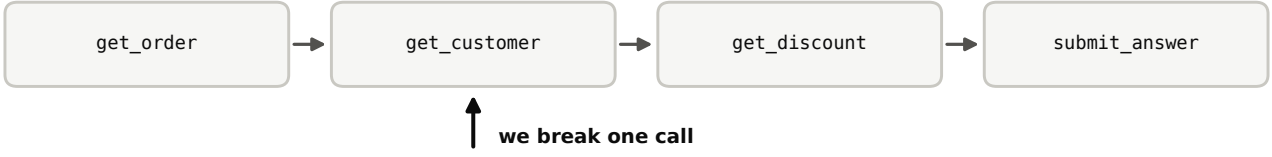
A task: for order O241, apply the customer's tier discount to the subtotal

one correct answer, known in advance



ET

errors once, then works

correct: call it again

IT

returns a bad id,
next call fails

correct: re-query upstream

EP

errors every single time

correct: report failure

Each level is tested only on tasks it already solves every time with no fault present,
so a failure here reflects the fault rather than the difficulty of the task.
